

PINS LITERALLY BLOW APART WHEN  
THEY GET HIT BY THIS BALL. MUST BE  
THE BOMB WE PUT INSIDE IT.

Exceeding our other Wolf balls was no small challenge; then our engineers dropped the bomb on us: a revolutionary core design that uses a small weight within the core to create the ball's offset mass bias (or b.o.m.b., for short). By placing the bias in different directions from the pin, you can fine-tune the angle of the breakpoint and backend hook style. In fact, after choosing the pin position, you can match up the ball's rev rate and hook motion with your playing style and lane condition.

With a mass bias 4 times stronger than any standard pin-out or other offset ball, Timberwolf combines a wider range of ball motion with the rare ability to make the strong layouts even stronger and the control layouts more predictable.

What's more, it all comes wrapped in our strong-gripping, smooth-rolling MegaBite™ Super Tack II reactive veneer for energy control at the breakpoint and more backend consistency. To experience Timberwolf, visit your pro shop today.
