

Nanotechnology is the study of manipulating matter on an atomic and molecular scale. A breakthrough in coverstock technology rarely happens due to the complex nature of chemistry and polymer science. Yet our new release will glide through the heads more easily than the original Virtual Gravity™ Nano yet still handle heavy oil.

In looking for different ways to expand the benefits of nanotechnology, we explored several additive options to the base NRG coverstock and found that adding mica to this shell material created a cleaner glide through the heads without sacrificing any of its ability to handle larger amounts of oil. You'll see increased entry angle with the new Virtual Gravity Nano Pearl with simultaneous amplified oil traction usually reserved for textured solids.
