

Dynamic Drilling

The **AMFORCE** system is a coordinated line of high performance bowling balls that should be drilled according to AMF custom drilling specifications. This is the same idea as performance automobiles with factory parts and professional tuning.

To get the most from your system, use either of the two recommended custom drillings provided with each ball. These drillings can also be found in the "Pro Shop Operator's Guide to AMF Ball Drilling Techniques." Have each one "tuned" by a professional and then rely on **AMFORCE** technology to deliver the reaction you want.

AMF recommends custom drillings that enhance each ball's designed performance (e.g. a ball designed to skid, snap should not be drilled to roll early.)

Note: If the recommended custom drillings are not comfortable or appropriate for the bowler's style, refer to the "Pro Shop Operator's Guide to AMF Ball Drilling Techniques" for other drilling options.
