

AMFORCE REACTIVE

STANDARD REACTIVE

*AMF's all new AMFORCE reactive veneer has microscopic cleats that deliver more traction and backend reaction than the standard reactive.*

## **Compound Control**

*The most versatile ball system ever has two distinctive cover formulas that complement each different core and provide two entirely different motions.*

- **VersaCover™ I** | digs into the lane surface for more traction and an even arcing backend reaction.
- **VersaCover™ II** has the strong traction, as well as a much stronger backend reaction with a greater ability to react more on the backend of the lane.

## **VersaCover™** **An All New Polymer Compound**

*More reactivity and versatility than ever before. VersaCover™ has a large hooking ability: the front end characteristics of a standard reactive shell with a much more aggressive backend reaction. "Tune" these covers for even more reaction by sanding or polishing to increase overall hook or the backend reaction.*
