

THE AMMO™ IS LOADED.

Gunpowder
Urethane

The Ammo's 3-piece construction features a high torque M90 weightblock surrounded by a new gunpowder urethane. They allow the Ammo to penetrate deeper and release stored energy at impact.

The AMF Ammo is ballistic design applied to bowling. It features an M90 weightblock that delivers end-over-end torque and drive down the lane. The result is an explosive release of stored energy at the point of impact.

But that's not all. The Ammo's M90 weightblock is surrounded by a friction factored gunpowder urethane coverstock. When this gunpowder formulation mixes with today's oil

applications, it reacts by grabbing the lane, going longer and penetrating deeper into the pocket.

With a carefully calibrated combination of power and precision the Ammo goes for the heart of the target and strikes with deadly force. So to get truly high caliber power, load the AMF Ammo. If you're rolling anything else, you're just firing blanks.
