

The Spiral of HELIX

Quantum introduces **HELIX**, the first ball in the universe to roll on two complementary cover stocks. Innovators at Brunswick Technology Ventures (BTV) have developed a unique process that fuses a ring of **CONVENTIONAL** urethane within a sphere of **REACTIVE** urethane, maximizing the advantages of both. The result is a ball that can gauge hook— not only in terms of *how much*, but also *when* and *where*.

Its
mission
is **C O N**

Helix Quantum

Dual surfaces. Dual purposes. Initially, the ball rolls on the Power Stripe of conventional urethane, guiding it straighter through the heads and preventing it from overreacting early. Resistant to tracking, this cover stock is also less likely to absorb oil from the front end of the lanes. And releasing Helix onto its conventional urethane surface increases its long-term durability. As the ball continues its revolutions, it flares out to the reactive urethane which generates a more powerful backend reaction. Available in right or left hand models.

12-16 lbs. • Hook Potential 17-9 (Dull/Shiny) • Length 7 • Backend 9.5

Sage Tour Quantum

New reactive urethane formulation gives this special Tour edition a longer roll and an even later-breaking hook. Also, backend hits a new high.

12-16 lbs. • Hook Potential 18.5-9.5 (Dull/Shiny) • Length 4-5 • Backend 11
