

# It's what's next. Now.

Don't wait for the next step in bowling ...

**Quantum Navy.**

**Coverstock:**  
Proactive

**Traction Characteristics:**  
Delayed Traction Effect (DTX) 1

**Weights:**  
10-16 lbs.

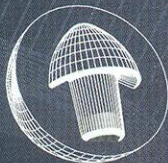

**Hook Potential:**  
20-13 (dull/shiny)

**Length:** 4

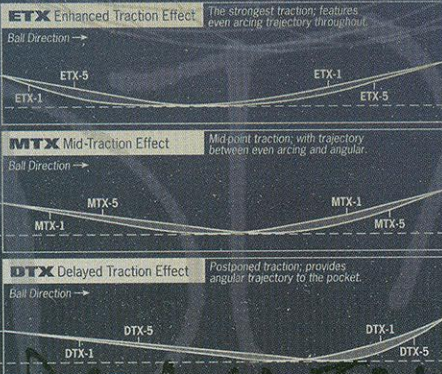

**Backend:** 11

**Average RG:** 5.3

**Track Flare:** 9.2

Traction Characteristics are designed to grip the lane at different points, in different degrees. The concept has caught on as competitors try to imitate Proactive. But whatever they call it, it can't be Proactive unless it says so. Only BTV, the industry innovators, developed Proactive. Only BTV has the patent pending. Anything else is an impostor. Anything else is something less.

... take it now with

**Quantum Navy.** First, Proactive created a whole new category of coverstocks. Now, science and sport reunite to give bowling Delayed Traction Effect (DTX). Quantum Navy offers all the benefits of Proactive (greater traction, greater resistance to tracking, reduced over/under reactions, increased hook potential), with the specific advantages of DTX (more length and a sharper breakpoint compared to MTX and ETX with more control at the breakpoint, and a higher hook potential than reactive). With Quantum Navy, the wait is over.
