

Introducing the BOMB, the most devastating device ever packed into a bowling ball. It turns pins into shrapnel, opponents into jelly.

The BOMB (for **B**all's **O**ffset **M**ass **B**ias) is the first true bowling advance to improve the game of both the high rpm and low rpm player.

In our new Tomahawk High Torque ball, the BOMB provides more flare potential. This allows the lower revolution player to increase the turning force on the back end.

In our new Tomahawk Low Torque ball, the BOMB helps create less flare. This helps the higher revolution player control the violence of the breakpoint.

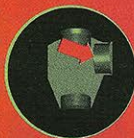

Both balls also feature our new Detonator veneer. This strong gripping reactive resin with mica increases the BOMB's accuracy in medium and heavy oil conditions.

Add the frightening power of the BOMB to your arsenal. Just visit your local pro shop today.

High Torque Core

The BOMB is a dense millable ceramic weight offset inside the ball's core. In a high torque ball, the mass bias created is the strongest ever in a level three core. In a low torque ball, the mass bias is four times as strong as in a standard pin out ball.

Low Torque Core
