

# Massive Power.

## New Power Core Technology

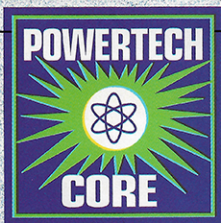

The newest introduction into the high-tech resin market, the Critical Mass™. Beneath the Versathane™

coverstock is a uniquely powerful 2-piece core configuration capable of generating the lowest radius of gyration possible in any bowling ball. The Critical Mass™ requires less hand action to achieve maximum revolutions. The critical core contains the densest material ever placed in a bowling ball thus giving Critical Mass™ its unique spinning roll and sharp hook. Due to the

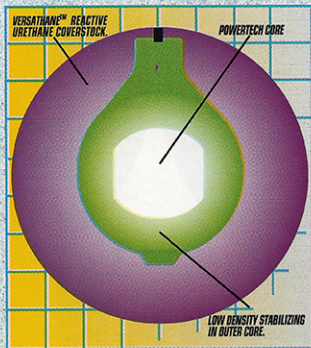

extreme density of the critical core, attempts to drill into the Critical Mass™ deeper than 3 inches may result in damage to drilling equipment.

## The Secret is in the Core.

Many have tried to produce a ball with the free-spinning roll and sharp hooking action of the Critical Mass™, but until now only TRACK has developed

the density formulation required. By matching the dense core, to the energy storing Versathane™ coverstock, the bowler achieves maximum energy potential on every shot while requiring minimum release energy (hand-action). That's good news for the average bowler and great news for the serious amateur or pro. Get your hands on a Critical Mass™ today.

**CAUTION**  
DO NOT DRILL  
BEYOND 3 INCHES
