

# Nuke the Competition.

## Track Introduces the New Bowling Technology.

The complexities of bowling ball design technology blend together in the Nuke from Track, Inc. The Nuke is the first product ever developed using Versathane, the only variable resin urethane formula developed to be used on a wide range of lane conditions.

In a dull, sanded state, the Nuke will hook on the oiliest of lanes. Polish the Nuke and it becomes a reactive tack-a-fied resin ball. Versathane allows the bowler to alter the surface of the Nuke to perform on any possible lane condition. The Versathane coverstock surrounds an innovative 2-piece core designed to roll through the heads and flip in the back end.

## More Control Means Higher Scores.

Nuke's power core is comprised of a stabilizer block and a flip block. The stabilizer block sets the ball up on its preferential axis on the front part of the lane, which yields a smooth, steady roll pattern through the heads. The mushroom shaped flip block creates an enormous snap on the back ends. This powerful combination of roll and flip increases your pin carry on pocket hits as well as greatly improving your striking power on half-pocket and high hits.

In short, the Nuke increases your overall striking percentage dramatically. Get a Nuke today and Nuke the competition.
