

**Dynamically imbalanced outer core.**  
**Patented ceramic Powertech core.**  
**Low radius of gyration ball.**  
**Ever changing preferential axis.**  
**Powerful in backend, controllable in front.**

You're armed to the teeth.

The Sensor II Plus™ features Track's patented Powertech core designed to generate the lowest radius of gyration attainable in any ball on the market today. It contains a dense inner core thus requiring less hand action to achieve maximum revolutions. The Sensor II Plus™ allows for a maximum flare potential of 3½ inches in a basic over the label drilling as opposed to substantial label shifts required in competitive products to achieve a similar flare pattern. This is achieved through the positioning and density variations of the high tech outer core. The Sensor II Plus™ delivers early roll. A 3½ inch flare potential means more traction because the ball continues to seek an ever-changing preferential axis thus rolling over a fresh oil free surface with each revolution. More traction means more backend reaction. And with its Pearlized cover it travels even further down the lane and reacts even harder in the backend. The moderately priced, smoke blue Pearlized Sensor II Plus™. There's no stopping you now.
