

# THE WINNINGEST BALLS ON THE PBA TOUR

## JUST GOT BETTER.

The new Synergy™ E-T-S (Energy Transfer System) only use 32% of its energy in the first 30 feet of the lane, performs like the original Synergies through the front part of the lane, but that's where the similarities end. Synergy E-T-S gets its intense striking potential from the Energy Transfer System which includes a flip block density increase of 23% and radius of gyration differential increase of 27%. The built-in Energy Transfer System quickly and dramatically transfers energy from the roll axis to the flip axis, creating a massive backend reaction. This ball will

only use 32% of its energy in the first 30 feet of the lane, leaving an amazing 68% of the power for the crucial last 30 feet. This reaction generates a steeper entry angle giving bowlers a devastating angle of attack. The Orange Flame Synergy E-T-S. If it were any more advanced it would be illegal.

The New Bowling Technology.™
